

DHS Fusion Center Mobile Applications

Problem Statement:

- Local and state authorities need near real time situational awareness and information exchange

Technical Approach:

- Develop a mobile application front end and serve side components that enables near-real time situational awareness of the location of the first responders in the field
- Develop a mobile framework for the information exchange between local and state authorities and the fusion centers on mobile devices
- Establish an iPhone-like application library

Benefit:

- This effort will set a new direction for first responder applications, establishing a first responder open source community, and allowing innovation while creating a market
